

BrightTV Viewership Analytics

Case Study — Project Description

Background

BrightTV's CEO has set an objective to grow the company's subscription base for the current financial year. The Customer Value Management (CVM) team has been tasked with using subscriber and viewership data to identify opportunities that support that growth objective. This project delivers the data analysis, dashboards, and recommendations requested by the CEO.

Dataset

Two source files were provided: a **User Profiles** table (5,375 subscriber records including demographic attributes) and a **Viewership** table (10,000 session-level viewing records). Each row in the Viewership table represents a single viewing session for a subscriber. Timestamps in the raw data are supplied in UTC and were converted to South African Standard Time (SAST, UTC+2) as part of processing.

Objectives

- Provide insights on user and usage trends of BrightTV.
- Identify the factors that influence content consumption (time of day, day of week, channel, demographics).
- Recommend content strategies to increase consumption on currently low-performing days.
- Recommend initiatives to further grow BrightTV's subscriber base, informed by dormant/active subscriber analysis.

Approach

- **Data cleaning & transformation (SQL, Databricks):** resolved a duplicate/mismatched subscriber ID column, consolidated inconsistent channel name spellings, converted timestamps to SAST, derived time-of-day, day-of-week, and session-length classifications, and built an Active/Dormant subscriber flag.
- **Excel analysis:** formula-driven summary tables, pivot tables, and charts covering channel performance, viewer behaviour, and audience segments.
- **Dashboards:** the same analysis was rebuilt across Google Looker Studio, Power BI, and a custom web application (Lovable) to demonstrate the analysis translating across BI tools.
- **Presentation:** a final stakeholder-ready presentation summarising findings and recommendations against each of the CEO's four objectives.

Key Deliverables

Deliverable	Description
SQL Code	Databricks SQL transforming raw data into session-level fact and subscriber-level dimension tables
Excel Analysis	Formula-driven KPIs, pivot tables, and charts across 5 dashboard pages
Power BI Dashboard	5-page interactive dashboard with DAX measures
Looker Studio Dashboard	5-page interactive dashboard, cloud-hosted
Web Dashboard (Lovable)	Custom-built interactive web application
Presentation	Stakeholder-facing summary of insights and recommendations

Key Data Notes

- Times/dates are supplied in UTC and converted to SAST throughout the analysis.
- Consumption is per session — one row in the Viewership data equals one viewing session.
- A duplicate/mismatched subscriber ID column was found in the raw export and resolved by trusting the column that matched 100% of subscriber profiles.
- Channel name spelling variants were consolidated before aggregation.
